Autism and Metaphysics

Abstract:

In my article I would like to point out the Asperger syndrome, because this autistic personality disorder has a so-called “acting out” between the process of “subject superior”, (in Whiteheadian philosophy it’s the “superject”1) and that of the “subject interior” which means the personality’s reality in the human psychological integrity. The superject dominates the person who has a schisis between its social and the own personal integrity. The individual psychological processes are under the superior reality. But the superior reality is the patient’s stronger psychoentity above the own personality. Reality versus psychological continuity – psychodynamic process contra social reality – metaphysical supremacy contra psychical process of the emotional interiorization: “out” inside of the own personality, but not “out” from personality. “Psychopathy, not psychosis” - as was said by Hans Asperger immigrant Austrian pediatrician. But we haven’t really got a psychoanalytical model for this syndrome, so we cannot make analytical therapy for an analytical intellectual disorder form.

Keywords: autisms, metaphysics, brain, process, spontaneity, subject, superject

Introduction:

The question has been put into focus recently: is the Whiteheadian process2 reproducible e.g. in a hermeneutic situation?

The hermeneutic situation is narrative but the process from Whitehead is universal. Our scientific plan is to involve the narrative repetition into universal categories. This will cathalyse the Whiteheadian universal process to overcome its philosophical generality so that it becomes in itself a process experienced completely by the Self. My aim is to portray the spontaneity of the psychodrama and the metaphysical constant of the Whiteheadian process into one complete system - at the same time lived and observed - and in the end not to just solve the metaphysical but also the psychological understanding of the superject.

In other words, are actors of a debate capable of producing the same reality? The spontaneity is at the same time constant and changing: if we are able to act out the Whiteheadian universality of the process whilst seeing ourselves from above then there is no contradiction between the happening and the experiencing of the process. This is how the Whiteheadian metaphysic will become a self-experience in its ordinary "vulgarity"; but not in a philosophical way anymore, but as a tool of scientific psychoterapy. Because if I confront the patient with a part of itself that can't be seen in the superject but is actually him/her, than the practice of the experience of the universal self will under-or overcome all the games between the subject and the superject.

The actors' integrity of subject and superject is unified, it includes the superior and the concrete forms of being, from dramatic areas to "vulgar" life processes. We represent through the article psychodramatical psychoanalysis in phenomen of Asperger-autism. The autism is a metaphor of our acting out in our personal life, but not only in our subject, also in our "actual superject", as the aspergerian autists can view the world and themselves from their universal superiority. This represents the possibility to create contemporary psychological (namely psychodramatic, heterodox psychoanalytical and cognitive psychological) methods, the theoretical completion of which will take more time.

If the duality of the superject-subject game can be resolved and understood in a spontaneous psychodramatic experience, than the Whiteheadian constant will complete and synerge the Morenoian spontaneity. This way Whitehead will submit as psychology, and maybe sixty years after Moreno we can create the metaphysical theory of the psychodrama. These are the mutual benefits of the synergies between psychodiscipline and philosophies. The upper context dissolves the actual difference between events and spontaneity, the actor is the human being, and the human being is the eternal actor without drama: this is the "spontan

process reality" - eternal and real. In our research we have rendered the philosophical process of the Whiteheadian superject-subject relation phenomenon into a special dramatical language-game, which may provide a model for the scientific understanding of the – theoretically to this day unborn – narrative concepts of the post-modern period: language-game as a „science of reality”, that is to say psychological practice. We would like to introduce a language-game in the following: the dramatic appearance of the process and the reality in the superject.

The conclusion of this language-game is that the subject playing with the real process metaphysically defines the superject — this is the natural human condition. The honest revelation of the superject however excludes the above position. Thus the post-modern science gains a particular position: it realises the disappearance of the metaphysics in the new process eighty years after Whitehead. This recognition itself creates the metaphysics — the question goes and still the question remains. In our psychosophical game the superject is the psychiatry, but we are the subjects like autistic children in process: this is a socialpsychiatric „liberator” game for the really ill children in „reality”.

In our paper we would like to manifest the discourse of a Whiteheadian approach in practical clinical psychology, especially in psychotherapy of Asperger-autism. We wish to dedicate our work for Whiteheadian interpretation of this narrative science.

Discussion:

It is common to address autistic disorder as “pervasive” or “comprehensive” ontogenetic disorders because they affect all areas of adolescent psychological development negatively. But as the expression itself suggests the truth is that we are not directly aware of the specific disorders. As it will turn out we cannot deal with autism as a complex disorder, we should rather use the term in plural i.e. autisms and autistic disorders.⁴ ⁵

---

In my lecture I would like to point out the Asperger syndrome, because this autistic personality disorder has a so-called “acting out” between the process of “subject superior”, (in Whiteheadian philosophy it’s the “superject”6) and that of the “subject interior” which means the personality’s reality in the human psychological integrity. The superject dominates the person who has a schisis between its social and the own personal integrity. The individual psychological processes are under the superior reality. But the superior reality is the patient’s stronger psychoentity above the own personality. Reality versus psychological continuity – psychodynamic process contra social reality – metaphysical supremacy contra psychical process of the emotional interiorization: “out” inside of the own personality, but not “out” from personality. “Psychopathy, not psychosis” - as was said by Hans Asperger immigrant Austrian pediatrician. But we haven’t really got a psychoanalytical model for this syndrome, so we cannot make analytical therapy for an analytical intellectual disorder form.

The Asperger syndrome (AS) has been in use as a diagnostic criterion since 1944; it was called then “Autistic psychopathy”. It only got the name Asperger syndrome referring to the first diagnostician from Lorna Wing psychiatrist and from her psychoanalyst colleagues in 1981. After all it was only involved in the official system of DSM-IV 7 8 as a unique syndrome in 1994 and it is still much debated etiologically and from other aspects.

It is interesting and its importance will be emphasized later that the male versus female occurrence rate is 6:19, and it does not show symptoms in early childhood while other autisms do so. Its real occurrence is frequently met after the age of six. Even today it is considered by clinical child psychologists as a child psychopathy and no etiologic relation is seen between psychotic and neurodegenerative autisms. The fact that the IQ of children with AS is usually outstandingly high – often exceeds the value 140 – provides further support of this idea. We are going to point out that the classification spread in the ‘90s was totally wrong by saying that this is a mild form of autisms10 11 as opposed to the seriously retarded Kanner’s syndrome.

which was considered as a severe form of autism in this old classification. After 1994 we cannot even talk about such a division.

**Psychological models:**

It is much debated whether it exclusively hits boys. There are many arguments which say that we tend to pay more attention to boy gender samples\(^\text{12}\), especially when they show extreme intellectual capacity. Though the above mentioned prevalence rate is generally accepted: it is unquestionable as for the contemporary statistical data. Its frequency is 2/10000 (though as we know the prevalence of every autistic clinical aspect has dramatically grown in the last 20 years these are also official data from 1995 further on)\(^\text{13}\).

If we take a look at the latest psychological function theory of AS (Baron-Cohen EQ – SQ theory)\(^\text{14}\) the male–female rate proves even more to be right, functionally too. This is because besides the extremely low EQ and extremely high IQ and SQ AS strengthens the convergent comprehensive function so it results in a high organizational intelligence and in a lower emotional intelligence adversely. So the convergent male-hemisphere function is extremely dominant and the divergent feminine functions are not only incapable of communication with the convergent functions, but they are behind\(^\text{15}\).

If we look at the model described above from the aspect of psychodynamics including emotionality, it seems to be easy to establish a psychoactive model for a psychopathic scission between the systematic and unsystematic cognitive, emotional and personality-structure-functions. This gives a good example for the more and more accepted model which says that children with AS are likely to become adolescents or adults with borderline personality disorder.\(^\text{16 17}\) We do not yet hold credible statistical data about this, but more and more

psychodynamic systems state that there is successive relation between childhood psychopathy with AS and adulthood psychopathic pathographies especially borderline syndrome. It would be a mistake though to apply the so called “minified adult model”; AS is a unique pathography of psychopathy.

**Our psychoanalitic therapeutical possibility:**

This is the sort of diagnostics having numerous psychoanalytic moments and the possibility of a complex Ferenczian approach be built on it. The disorder does have a psychoanalytic history too, but its psychoanalytic approach in terms of therapy is a real scientific vacuum.

Since the making of the Baron-Cohen theory (1991) AS is considered as a ‘male brain disorder’ thus an excessive male hemisphere function (the boy : girl rate is 6:1). In a quite curious way the SQ and the IQ is often extremely high with people suffering the syndrome while their EQ is somewhat lower or very low (AS is also measured by SQ-EQ relative tests). It is also known that convergent functions extremely dominate divergent functions. Our psychoanalytic hypothesis puts up the question of whether the convergence can be described in this case as a rational ego – self ideal – superego function (we must not forget that the disorder is the most intensive between ages 6 and 10 with boys thus in the latency period and it debuts in the age of six, sic!) and describe the lack of divergence by that “Thalassa – function” from which the “good boy” idealization segregates children?

If this is possible – though it is only a theoretic experiment yet – it would provide a chance for a mutual Ferenczian psychotherapy in the case of a pathography which has been described by psychoanalysts but has never been treated psychoanalytically.

The game is over – the game begins, but out of the walls of high secure psychiatrical clinics: in a socialpsychiatrical context from child to child; into the game of integrated subject-superject and not only in process of reality, but also in reality of process; from in to out and from out to in: into anthropological integrity of a little child – in therapeutical practice. The metaphysical approach is a way for psychodramatic psychoanalysis to create the foundation for its own theory from metaphysics. The metaphysical discourse will be based scientifically without borders between psychological science and metaphysics.
